Attitudes

ABSTRACT

The seminar on assessment and accountability in education was believed to be the first national conference concerned with these coordinate issues. The participants generally concurred that accountability is a wany faceted phenomenon with varying interpretations. It was further agreed that the major obstacle to setting up measures of accountability has been a lack of knowledge: school personnel have not known what to do or what to identify in demonstrating and describing the effectiveness of the educational enterprise. Before school personnel can be held completely accountable, there must be a sharper focus on the goals and objectives of teaching and learning. (Author/WM)

I D E A is the service mark for the Institute for Development of Educational Activities, Inc., the educational affiliate of the Charles F. Kettering Foundation.

I D E A was established in 1965 to encourage constructive change in elementary and econdary schools. It serves as the primary operant for the Foundation's missions and programs in education. More information about I D E A and its programs is available from I D E A, 5335 Far Hills Avenue, Dayton, Ohio 45429.

On March 28, 1974–22 nationally prominent educators, knowledgeable about and involved in assessment and accountability, convened at a seminar in Atlanta for the purpage of analyzing this rapidly proliferating and increasingly controversial i.sue.

The conferees were charged as follows:
"Assessment and accountability are among the most critical issues facing educators today. Within the last several years, 37 states have instituted some kind of program of assessment and accountability, and activity is burgeoning in the rest of the states. The purposes of this seminar are to examine the state of the art; see where we are with the movement; critique it; and report honestly to educators and the public on what is being done, how it is being done, and what should be done."

The conference agenda was planned and implemented to include treatment of the accomplishments and present status of national assessment, the status of statewide assessment and accountability, and future directions of the movement.

The conferees were provided with materials prepared by the Education Commission of the States: the National Association of School Boards of Education, the Center for Statewide Educational Assessment, and the Cooperative Accountability Project.

George B. Brain, dean of the College of Education at Washington State University, placed assessment in its historical perspective when he wroter. The assessment of performance is an age-old practice. The last verse of the first chapter of the Pook of Genesis reads, 'And God saw everything that He had made, and behold, it was good. That single act of the Creator apparently established the precedent for a practice of assessing all human behavior. Even though man lacks godlike anniscience, he tries to follow the precedent, and it was only logical that in time the concept of assessment cam, to be applied to the field of education.

"The process of assessing the educational attainments of students began almost four thousand years ago. The records of the Shun Dynasty of ancient China report an elaborate system of achievement examinations which provided the avenue of entry to the civil service....

"Assessment played an important role in the early development of public education in this country. Horace Mann made provisions for a system of evaluation and reporting in his plan for education for the state of Massachusetts... When the U.S. Office of Education was established in 1867, one of the duties given to the U.S. Commissioner of Education was to de-

termine the prepress of education.

"Assessment began to become a science, or at least a developing technology, in the early years of this century. Now with the proliferation of wide scale evaluation programs, with the perfection of electronic test processing equipment, and with public pressure for accountability in the educational enterprise, assessment continues to play a leading role in the process of education."

The 1954 decision of the U.S. Supreme Court, in the historic case of Brown v. Board of Education of Topeka, Kansas, signaled the beginning of a revolution in American education. Congress began appropriating vast sums of raoney for compensatory education and a variety of other programs in efforts to equalize educational opportunities for all the nation's citizens. Since the U.S. Office of Education is responsible for designing, implementing, fund-

ing, and evaluating federally funded programs, in 1963. Francis Keppel (then U.S. Commissioner of Education) began talks with a number of educators on the feasibility and need for a nationwide study to describe for the American public the educational attainments of various groups. The idea of a national assessment program encountered considerable resistance because it was confused with a nationwide individual testing program. Many fears, including fear of a national curriculum, were expressed by those who were unsure about the processes and procedures which the assessment program would employ.

establishment of the Exploratory Committee national assessment began in 1964 with the on Assessing the Progress of Education As a result of Keppel's concern, planning for (ECAPE). ECAPE was established with Carsibilities of a national assessment and develop plans and instrurzentation for its conduct. The negie Corporation funds to investigate the poswork of ECAPE resulted in the design currently of 1969. The program currently receives its followed by National Assessment of Educational Progress. The actual administration of the exercises in the schools began in the spring major funding from the National Center for Educational Statistics in the U.S. Office of Education.

Seminar participant Ralph W. Tyler was chairman of ECAPE and because of his leadership is commonly referred to as the "father" of national assessment. In his initial remarks to other conferees, Tyler indicated a major purpose of the national assessment program is to provide the icy public with census-like data

ERIC

In December 1973, the Center for Statewide Educational Assessment, an affiliate of Educational Testing Service, Princeton, New Jersey, reported 60 assessment programs operated by the 50 states, the District of Columbia, Puerto Rico, and the Virgin Islands.

Most programs have formulated statewide goals and, in 31 states, those goals have been formally adopted. Forty-nine states assess by grade level but 12 of these also assess by age level. In those states that utilize grade level, grades four, six, and eight are most often assessed. However, state assessment programs based on age level most frequently assess ages nine, 13, and 17.

Practically all programs were initiated by state educational agencies—some prompted by state boards of education and others man-

dated by state legislatures.

All statewide programs are coordinated and administered by state educational agencies, often utilizing outside consultants or contractors. Fifty-eight of the 60 programs are mainly concerned with assessing cognitive areas such as language arts and mathematics. Forty-one programs include some noncognitive areas with attitude toward school, self-concept, and citizenship being assessed most frequently. A majority of the programs utilize standardized instruments although many programs also

Michigan

57

In Michigan, the state department of education initiated a state assessment act which was legislated in 1969. This act required the department of education to begin planning and developing a state program for the purpose of conducting a periodic and comprehensive assessment of educational progress. In 1970, additional legislation mandated a more comprehensive assessment program of assessment of educational progress and remedial assistance in the basic skills of reading, mathematics, language arts, and/or other general subject areas. According to seminar participant Philip

t which months norm referenced tests were being utired to assess in the areas of reading, matineling and matics, and language arts. The data collected created serious technical and political problems which resulted in norm-referenced instruments being discarded in favor of objective-referenced.

actment of the 1970 legislation, within six

This change in instrumentation necessitated the identification and utilization of scholars, teachers, and citizens in translating the common goals of Michigan education in the basic skills areas into minimal expectations or measurable objectives. These groups established the best estimates of minimum competencies students should achieve at specific points in the

Kearney, the staff had proposed to conduct a three-year pilot effort. However, with the en-

educational process. Once the objectives were determined, the state department contracted with four local school districts to develop the items and assessment exercises. A testing agency was employed to assist in the development of the battery.

The major purposes of assessment in Michi-

- to provide the state with information needed for allocating state funds and professional services in a manner best calculated to equalize educational opportunities so students can achieve competence in basic skills
- to provide school systems with strong incentives for introducing educational programs that will improve the education of students in basic skills and model programs and raise achievement levels
- self-renewal that would continuously evaluate the programs, thereby helping each school discover and introduce program changes designed to improve the quality of education.

The assessment program in Michigan, therefore, is designed to provide information for decision making at the state, district, and school levels. Data is presently being collected at the beginning of grades four and seven. When the program is fully implemented, data will be collected at five points along the educational continuum — at the beginning of grades one, four, seven, and ten, and during the spring of the 12th year. Full implementation is targeted for the

1976-77 school year.

The State of Michigan has also assumed leadership among the states in exploring and applying accountability procedoures. As a reaction to the vigorous Michigan program, the Michigan Education Association and the National Education Association recently secured the services of three researchers to examine the quality and implications of that leadership. The specific purpose was to assess the educational soundness and utility for Michigan of the State Accountability System with particular emphasis on the assessment component. This effort culminated in the release of a highly critical report in March 1974.

The staff of the Michigan Department of Education responded to the study in a detailed reply. Of the nine recommendations made by the researchers, six received the full support of the staff and appropriate modifications were promised. There was profound disagreement with the other three recommendations and the staff expressed hope that future discussions will resolve the differences of opinion.

Florida

In Florida, the state department of education initiated statewide assessment legislation in 1970. A statute was passed requiring development of evaluation procedures designed to objectively assess educational programs offered by public schools of the state.

The Florida program utilizes criterion-referenced and norm-referenced instruments. As in Michigan, various school systems were selected for the development of performance objectives, test it ems, and assessment exercises.

The plan was targeted for implementation in reading by the 1971-72 school year, in writing and mathematics by the 1972-73 school year, and in other subject areas by 1973-74. A random sampling method was utilized rather than testing every student.

The information collected through the assessment program is utilized for decision making at the state, district, and school levels as well as for educational accountability.

Seminar participant, James W. Guthrie, (who assisted in developing the program) believes Florida is the only state which has made an effort to link assessment, objectives, and accountability.

The Educational Accountability Act was passed by the Florida legislature in 1971. It provides for implementation and further development of assessment procedures designed to assure that programs lead to the attainment of established educational objectives, provide information for accurate co. analysis, and furnish data for analysis of the differential effectiveness of instructional programs.

The chief complaints about the Florida program come from school administrators who deplore the "mountains of paperwork" connected with the program.

California

In California, teachers and administrators consider that state's accountability regulations "a paper tiger." They indicate the goals range from the obvious to the banal, and many teachers treat them lightly. The only virtue mentioned is that it stimulates teachers to keep talking and thinking.

The movement toward a concept of accountability seemed to gain impetus in the summer of 1968 when a Committee for Economic Development report issued an indictment against the public schools. The report indicated that many schools and school districts, handicapped by outmoded organization and lack of research and development money, were not providing responsible, and effective citizens. This serious the kind of education that produced rational, accountability educational in historical perspective

seems to have grown out of the passage of the tion Act of 1965 which gave the public schools gan to appear in the professional literature in 1969; however, the real focus of attention on it as a concept occurred in 1970. This concept far-reaching Elementary and Secondary Educaa new mandate. The caveat was not only for equality of educational opportunity, but also References to educational accountability befor equitable results. Under this new prescription, schools were expected to give every stu-

interest, background, home, or family income. When Leon Lessinger, the "father" of the accountability movement 'then an Associate dent basic competency - regardless of ability, Commissioner in the U.S. Office of Education) he was proposing a method of ensuring three began to use the term accountability in 1968, basic rights in education:

1. the student's right to be taught what productive and satisfied member of he needs to know in order to be a society

- 2. the taxpayer's right to be informed of the educational results produced by specific expenditures
- resources of society instead of being the school's right to draw on all restricted to the overburdened resources of educators ಚ

The method Lessinger championed for achieving the goal of guaranteed acquisition ucational results. This he referred to as the of basic skills was an independent audit of edprocess of "educational engineering." At that

ERIC Full flax t Provided by ERIC

point, discussions of accountability in educational circles shifted to consideration of performance contracting, external audits, program planning, budgeting systems, and voucher plans. Therefore, accountability — which was to be achieved by those methods — became secondary. The primary focus was on the methods themselves rather than on educational outcomes. As a result, the concept of accountability has been interpreted in many different and confusing ways.

However, a number of misconceptions are

gradually being eliminated and some degree of consensus seems to be emerging. Perhaps a contributor to this is the realization by educators that accountability implies a specific kind of responsibility — a responsibility to someone for something. The fact that there are consequences brings in the aspect of being accountable.

Although the present movement is but a few years old, the only thing that is relatively new about the concept of accountability is its application to the outcomes of the educational

JI

process. School officials have always been accountable to taxpayers for the proper receipt and disbursement of funds, to parents for the safety and custodial care of students, to college officials for the quality of college preparatory programs, and to accreditation and professional associations for a variety of input standards. The negative consequences include discharge from a position, criminal indictment, and loss of accreditation. The benefits include continued support, increased trust by clients and patrons, and credibility.

current status of educational accountability

raphy on accountability in education some years ago, he found very few references. Today, there are more than 4,000 books and articles relative to the subject; but they only add to During the Atlanta seminar, Lessinger asserted that, when he attempted to do a bibliogthe confusion by offering a wide variety of definitions. The conferees, however, seemed meaning ascribed to the concept. The basic to agree there is a widely accepted core of for what children learn. The concept not only includes responsibility for performance in idea it conveys is that school systems, schools, and the educators who operate them, should be held responsible for educational outcomes achieving goals and objectives, but also for selecting appropriate or relevant goals.

In spite of the attendant controversy, accountability appears to be alive and well in American education. By the fall of 1972, accountability legislation had been introduced in 29 states, enacted in 23, and at least 10 other states followed in 1973. So with the conditions that led to the birth of the concept continuing to proliferate, the prospects for an even more precocious growth seem inevitable.

The conference participants agreed that accountability and assessment are not synonymous even though some form of assessment is a necessary aspect of accountability. They also

school boards, administrators, teachers, students, or any other specific group. Nor is accountability to be confused with methods presumed to be useful in carrying it out such as performance contracting, system analysis, program planning, budgeting systems, or management by objectives.

The movement has, however, forced an added responsibility on the schools — a responsibility for stipulated outcomes, a quality assurance process, a type of external review to ascertain success or failure, and a system for publicly reporting the actual outcomes in relation to expenditures.

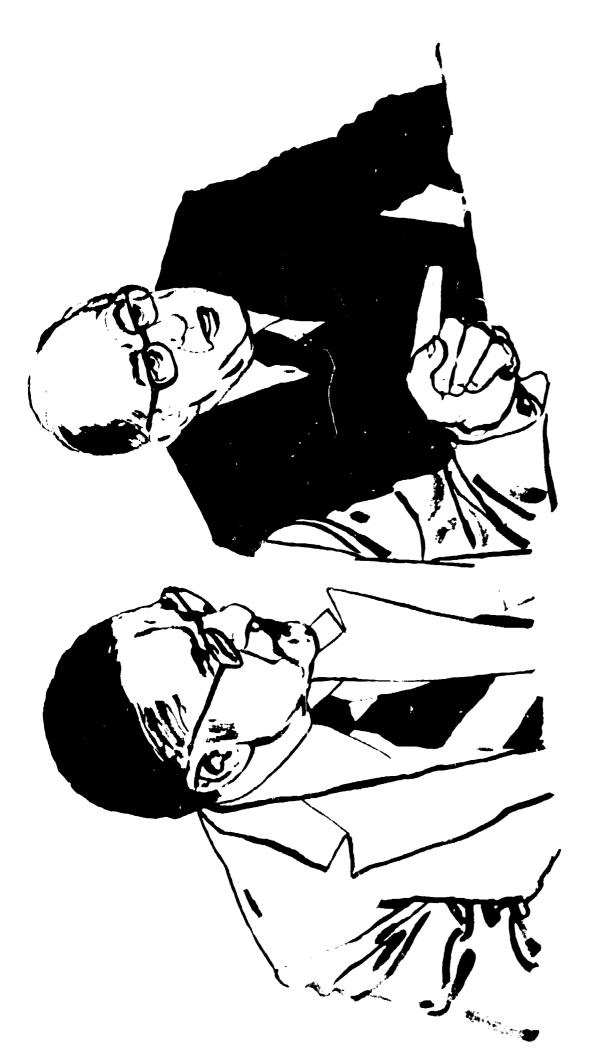

The conferees agreed that the total concept of educational accountability is three-dimensional. Perhaps, the delineation which follows will answer the often asked questions, Who is accountable to whom? and What are they accountable for?

- public for developing appropriate goals and objectives in relation to state goals communities; for ensuring the schools are staffed by competent personnel; for continually assessing the achievement systems, then, are accountable to the of students; and for disseminating the concept applied to school districts. It provide promised resources. School and needs and expectations of local involves the degree to which they System accountability is a broad personnel, parents, and citizens results and analyses to school through an independent and objective method.
- skills, and techniques revealed through research or analysis of the state of the appropriate instructional programs for utilizing instructional approaches that at an appropriate level of performance school administrators and teachers at art to be reliable in producing desired achieving stated objectives. Teachers consistent with preselected objectives knowledge and use of those attitudes, Professional accountability refers to administrators are accountable for outcomes. Specifically, building will produce program outcomes are specifically accountable for development and selection of the building level. It involves for the instructional program.

47

• Performance accountability is concerned with the effectiveness of programs and methods in achieving

objectives or they are redesigned and desired outcomes. These programs and methods must meet the stated implemented until they do.

how teachers view the concept of assessment and accountability

Accountability is a buzz word of increasing velocity in teachers' lounges and workrooms of the nation's schools. Many teachers view the cencept as a merit system, or a weeding system, aimed directly at them. Consequently, teachers feel the quest for accountability will become a major distraction from the real business of teaching and learning.

Justification for these negative views of assessment and accountability is seen in the fused to renew the contract of a teacher who 1970-71 lowa case in which a school district reson specified was that her students' scores on of Educational Development were too low. The had been teaching there since 1960. The reathe Iowa Test of Basic Skills and the Iowa Test Supreme Court declined to review the decision and left standing a Court of Appeals decision that evaluating a teacher on the basis of her school board authority. The Supreme Court's students' test scores is a reasonable exercise of fluence on future attitudes of teachers toward decision in this case could have considerable ineducational assessment and accountability.

The following items represent some of the concerns expressed by teachers and their organizations:

- Paperwork and record-keeping requirements of accountability will result in busywork and decrease available instructional time.
- Performance contracting so far has been a failure and has damaged the reputation of accountability.
- A public climate in which sound education is all but impossible will place more of society's failures at the educator's doorstep failures with which educators will be unable to cope.
- Many important goals of education cannot be assessed until students have graduated.
- By emphasizing objective measurement, attention will only be focused on those learning skills which can be easily measured.
- Emphasis on measurable performance will tend to stifle and retard innovative teaching efforts which are necessary to keep pace with the rapidly changing needs of society.
- The attempt to hold different educational levels accountable will create conflict where harmony is essential.

In February 1973, the board of directors of the National Education Association unanimously approved a declaration on educational accountability and authorized four immediate steps to fight oversimplified approaches to accountability. The steps are:

- 1. a state-by-state analysis of "hard data" to identify where the dangers now exist
- 2. coordination among NEA state and local affiliates to develop an action plan at all levels with positive implications that will place teachers in the leadership role
 - 3. investigation of possibilities for initiating legal action challenging misguided accountability rules
- 4. modification of national and state legislation leading to positive programs of accountability tor quality education.

NEA Fresident Catherine Barrett praised the board action as "... most significant in terms of the real concerns of our membership." She further noted "Compulsion about accountability in education has reached crisis proportions in at least 30 states and is spreading fast to all 50.

"Teachers nationwide will respond happily to accountability when they become autonomous enough to have part in shaping standards for certification and determining curriculum. We will be accountable when our knowledge about the needs of youngsters in school becomes a part of planning the total educational structure. Until then, governmental bodies and administrators will have to bear the responsibility. Students and teachers will no longer be victimized by a simplistic approach to a concept that has caught the public fancy."

how the conferees view the concept of assessment and accountability

the concept is viewed with suspicion. This Brademas when he described accountability as managerial system was in operation prior to or anti-tenure device, it is understandable that notion was expressed by Congressinan John serted that, in Florida and other states where various strategies of accountability are being successfully implemented, a very positive type consideration of any tools or strategies of accountability. In instances where accountability is being used as an anti-collective bargaining and outcomes. They conceded it could potentially change managerial opinions regarding how organizations operate. The group also asdefine education — its direction, approaches, a way of pointing a punishing finger at someone, particularly at teachers.

The conferees surmised that the organized teaching profession would respond positively to the concept if it made the classroom teacher's responsibility more explicit rather than emphasized their failures.

As a result of the conference deliberations, the conferees concluded:

3JBALIANA Y903 TZJA

• Because of the many variables that affect the outcomes of students' educational experiences, the problems of separating the effects of different teachers and administrators, influence of parents, and out-of-school experiences negate holding individual teachers totally accountable for student failures.

• Teachers' concerns gro of their definitions of accountability which partly result from the manner in which they hold students accountable.

The conference agreed that a very positive outgrowth of the concept is the necessity to

- Accountability can potentially force closer relationships among all levels of the educational enterprise as they focus on common goals of student learning.
- Accountability can promote the importance of parents and communities as an integral part of the total educational effort inasmuch as selection of learner objectives and establishment of priorities are emphasized.
- Accountability can stimulate the search for more efficient and effective ways of producing learning and an objective reexamination of educational practices and procedures.
- Accountability can conceivably improve communication bet ween schools and communities as a result of school boards and educators corroborating to clarify process and performance chiectives and relate efforts in terms of results.
 - Accountability car promote early diagnoses of learning deficiencies in the classroom and provide a basis for individualizing instruction.
- Teacher in-service programs designed to provide skills directly related to learner needs can evolve from ecountability.

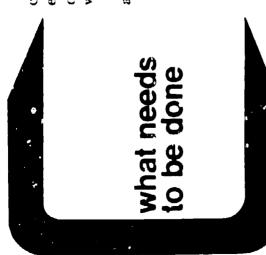

- Instructional materials can be selected on the basis of relationship to identified learner needs.
- As a result of accountability, teacher-training institutions should shift emphasis from the accumulation of required credits to the acquisition of required skills.
- In any system of accountability, each participant in the educational process should be held accountable only for

- those educational outcomes that can be affected by his own actions or decisions.
 - The extent to which an individual educator is expected to effect outcomes should be empirically determined by analyzing results obtained from all personnel working in comparable circumstances.
- Enlightened management teams and humanistic managerial principles are requisites for successful implementation

- of any system of accountability.
- Accountability should facilitate the establishment of objective and equitable systems for evaluating teachers.
- A clear statement of goals and objectives is critical for teacher evaluation. Information obtained through evaluation should only be used to supply feedback for the purpose of enhancing professional growth.

All conferees agreed that accountability is a viable concept that holds enormous potential for American education. However, they realized that much has to be done if the concept is to become functional on a nationwide scale.

Some of the approaches which need to be undertaken

- The U.S. Office of Education along with various foundations should initiate a massive research and dissemination effort on exemplary accountability models.
- A corps of people knowledgeable about the concept should be identified in each state and commissioned to be communicators in the dissemination efforts.

- Efforts must be intensified to appeal to the organized teaching profession rather than individual teachers. The logical and positive consequences of accountability must be defined.
- In addition to publications, efforts toward dissemination should include personal contact either on the basis of requests by school districts or preplanned area conferences.
- The National Institute of Education and foundations with educational affiliates should encourage test and measurement developers to sponsor programs for the purpose of helping the public and the profession correctly interpret data produced by various measurement devices.
